Curtis

This letter is to inform you of our findings after installing IceCold to our 30 ton HVAC unit within our Data Centre infrastructure.

Grayco Air our HVAC support vendor found that after adding the IceCold Catalyst to both circuits within the Air Conditioning unit they discovered a reduction in current draw amperage by approximately 10 percent and a reduction in compressor head pressure.

In addition, the discharge line temperature was also cooler by 10 degrees on both circuits based on pre and post readings from our data log system.

Based on the findings and reductions CGI will be moving forward and adding IceCold to remaining units that support the infrastructure.

Sincerely,

Todd Woods
