To Whom so Ever it may Concern

The team from **M/S Meridian Techno solution** approached us for energy saving "**Synthetic Catalyst named ICECOLD**" in our 2TR split Unit at our Network Server room in Logitech Park (Sakinaka).

Apart from the reading taken with HOBO data loggers, they also installed energy meters to take unit consumption on our split Unit.

We selected this unit, because we wanted to test the product on a unit which runs 24x7 and load is mostly constant (TR), we fixed our thermostat settings and did not alter the same for the entire testing period. We made sure that the only variable, on which we do not have control and can effect the cooling inside, was the outside ambient temperature.

After injection of Ice COLD in our 2 TR Carrier makes split unit, we kept the machine under observation for 15-20 Days with the same HOBO make data logger & energy meter. Looking at the readings before 15 Days from the Installation and after 15 Days from the Installation, there is Savings in Units by 12.4% with average inside temperature kept same and Average outside temperature was nearby same during entire testing period.

Saving of 12.4% on our unit consumption, as derived from the readings taken with energy meter installed is really very encouraging. We firmly believe and endorse the saving capability of this product.

Hence, we are satisfied with the Product and would like to recommend it.
